

Corn Disease: Northern Leaf Blight

Metadata

Crop: Corn
Disease: Northern Leaf Blight
Scientific Name: *Exserohilum turcicum*
Pathogen: Fungus
Source: ICAR, FAO

Overview

Northern Leaf Blight is a fungal disease causing elongated lesions and yield loss.

Symptoms

Early: small gray-green spots.
Advanced: long cigar-shaped lesions.

Similar Diseases

Gray Leaf Spot: rectangular lesions.
Rust: pustules.

Favorable Conditions

Moderate temperatures and moisture.

Transmission

Spreads through spores in wind and residue.

Management

Cultural: Crop rotation, residue removal.
Chemical: Propiconazole.

Prevention

Resistant hybrids, proper spacing.

Severity

Mild: few lesions.

Severe: extensive leaf damage.

Recommended Action

Apply fungicides and maintain field hygiene.
